Global X Covered Call ETFs – Key Takeaways

Takeaway 1 – U.S. Equities Staged a Sharp Recovery

Major domestic equity indexes entered the Global X Covered Call ETF suite's August roll period under pressure, but improving sentiment toward AI and a strong earnings season fueled a rapid recovery. Private asset manager Citadel's acquisition of distressed assets from the Situational Awareness Fund, an AI-focused hedge fund, helped restore confidence in the AI trade after a meaningful semiconductor drawdown that took place from late June through July. Corporate results reinforced the shift: 485 of the 498 S&P 500® companies that reported second-quarter results through August 15 delivered aggregate top- and bottom-line Q2 growth of 14.99% and 52.12%, respectively. Over the monthly roll period, the S&P 500® returned 3.02%, while the Nasdaq 100® gained 2.56%.

Takeaway 2 – Falling Volatility Promoted Value for Written Options

Almost all of Global X's 100% Covered Call ETFs outperformed their reference assets during the August roll period, with XYLD being the sole exception. Elevated volatility at the start of the period allowed QYLD to take in its highest premium since November 2025. Volatility subsequently fell sharply across the Cboe Nasdaq 100® Volatility Index (VXN), Cboe Russell 2000® Volatility Index (RVX), and Cboe Dow Jones Industrial Average Volatility Index (VXD). As a result, the value of the written calls declined, benefiting QYLD, RYLD, and DJIA's returns. Combined with premiums of 3.74%, 2.38%, and 1.11%, respectively, collected on July 17, this helped the funds return 3.86%, 2.74%, and 3.02%, respectively, compared with 2.56%, 1.99%, and 2.31% for the Nasdaq 100®, Russell 2000®, and Dow Jones Industrial Average, respectively.

Takeaway 3 – The August 21 Premium Values were Influenced by a Softer Volatility Regime

Lower market volatility resulted in more modest option premiums received at the start of the September roll period. The Cboe Volatility Index® (VIX), in particular, reached a year-to-date low of 14.25 on August 14 and remained relatively subdued despite rising modestly through the end of the roll period. Against this backdrop, XYLD collected a premium of 1.49%. DJIA also took in a premium of 1.03%. Meanwhile, QYLD, RYLD, and MLPD each collected more than 2%, allowing them to make distributions equal to their 1% monthly distribution cap.

Past performance is not a guarantee of future results. All fund return data is based on fund net asset value.

Tracking Index: An Index tracked by the funds.; 4. Equity Index: An Index used to measure the market value of a certain group of shares or stocks.

Global X Covered Call & Growth ETFs – Key Takeaways

Takeaway 1 – XYLG Outperformed its Fully-Covered Counterpart, XYLD

Maximizing premiums generally proved the more effective approach during the volatile August roll period, but XYLG was the exception among Global X's index-tracking Covered Call & Growth strategies. The S&P 500® initially fell -1.88% through July 29 before rallying 4.99% through the end of the period. Volatile as their price movements might have been, neither the Dow Jones Industrial Average nor the Russell 2000® Index experienced such a sharp rebound. The Nasdaq 100® did, advancing 7.84% over the final 17 business days, but QYLD's higher premium and the volatility decline discussed in our 100% Covered Call commentary helped it outperform QYLG. For the S&P 500®, however, XYLG's greater upside participation drove stronger relative performance than XYLD.

Takeaway 2 – TYLG Exhibited Relative Outperformance During the August Roll Period

The information technology sector has remained volatile, and TYLG collected the highest premium in its more than three-year history on July 17. This helped the fund outperform its reference asset, the Information Technology Select Sector Index, during the August roll period, returning 4.88% versus 4.40%. Outside the sharp advance that the Index experienced from its March 30 trough to its June 2 peak, wherein it returned 55.43% versus TYLG's 34.85%, TYLG has helped buffer tech volatility while still generating returns so far in 2026. Over the first three months of the year, the fund outperformed the reference asset by 3.63% (Information Technology Select Sector Index: -7.51%; TYLG: -3.88%). Since the Index's June 2 peak, TYLG fund has outperformed by 4.69%, declining -2.70% versus the Index's -7.39% decline.

Takeaway 3 – Global X's Covered Call & Growth Strategies Took Part in a Long-Awaited Advance for Crypto

From July 17 through August 18, the Coin Metrics' CMBI Bitcoin and Ethereum Indexes posted modest gains of 0.88% and 3.91%, respectively. Momentum accelerated on August 19, after the U.S. Treasury announced it would at least double the amount of longer-dated Treasury bonds that it would buy back from investors, from \$2 billion to \$4 billion per operation, between September 9 and November 4. Markets interpreted the announcement as a sign of mounting sovereign debt pressures, helping lift the two indexes by 19.28% and 26.21%, respectively, over the balance of the roll period. Writing weekly call options on roughly half their notional value, BCCC and EHCC had been outperforming the indexes up until that point. From August 18 through August 21, they proceeded to underperform but were beneficiaries of the rally nonetheless returning 9.02% and 12.89%, respectively.

Past performance is not a guarantee of future results. All fund return data is based on fund net asset value.

Global X Income EdgeSM ETFs Overview – ~25% Covered Strategies¹

Global X's Income EdgeSM strategies actively manage call option exposure rather than maintaining a fixed coverage percentage, allowing for positioning adjustments as market conditions evolve in an effort to target annualized distribution rates.

	EDGX	EDGQ
	US 500 Income Edge SM ETF	Nasdaq-100® Income Edge SM ETF
Primary Goals	Current Income and Growth	Current Income and Growth
Distribution Frequency	Weekly	Weekly
Net Expense Ratio	0.00% ² / 0.50% ³	0.00% ² / 0.53% ³
Tracking Index ³	N/A	N/A
Equity Index ⁴ /Long Exposure	Solactive GBS United States 500 Index	Nasdaq-100® Index
Options Moneyness	At- or Near-the-money ¹	At- or Near-the-money ¹
Portfolio Coverage Ratio	~25% ¹	~25% ¹
Options Strategy	Buys the stocks in the equity index and/or an ETF that roughly tracks the equity index and writes corresponding call options to pursue 9% annualized distribution rate.	Buys the stocks in the equity index and/or an ETF that roughly tracks the equity index and writes corresponding call options to pursue 13% annualized distribution rate.

1. Moneyness and degree of notional coverage may vary. We expect the funds' coverage ratio to average approximately 25% over the long term, though actual coverage may fluctuate meaningfully from week to week and is not fixed, targeted, or guaranteed.; 2. Net Expense Ratio: Reflects fees incurred by the Fund after waivers and reimbursements – fee waivers are contractual and in effect until at least March 1, 2027.; 3. Gross Expense Ratio: Reflects fees incurred by the Fund before waivers and reimbursements, including but not limited to management fees, 12b-1 fees, and acquired fund fees and expenses.; 4. Tracking Index: An Index tracked by the funds.

Global X Income EdgeSM ETFs – Key Takeaways

Takeaway 1 – A Floating Coverage Mechanism Allowed Income EdgeSM Managers to Position for the Market Recovery

As markets declined through July 29, EDGX and EDGQ were able to modestly outperform the Solactive GBS United States 500 and Nasdaq 100®, respectively, collecting weekly option premiums. Volatility rose toward a one-month high during this period. The Cboe Volatility Index (VIX) and the Cboe Nasdaq 100® Volatility Index (VXN) peaked at 20.66 and 30.84, respectively. The backdrop allowed the funds to collect premiums on July 31 of 0.16% and 0.25% and perform distributions of 0.17% and 0.25%, as well. All the while, they set the table for the upcoming week with initial coverage ratios of 24.08% for EDGX and 19.04% for EDGQ, preserving participation in the subsequent rebound. From July 31 through August 7, EDGX and EDGQ's reference assets appreciated 3.72% and 5.12%, respectively, while the funds captured much of those gains, returning 2.95% and 4.35%, respectively.

Takeaway 2 – The Funds Have Delivered Strong Relative Performance Since Inception

From February 17 inception through the end of this roll period, the Solactive GBS United States 500 and Nasdaq 100® have risen 13.25% and 19.06% on total return basis, respectively. In that time, EDGX and EDGQ have appreciated 12.16% and 16.14%. This performance is noteworthy given the mid single-digit losses that the indexes posted from fund inception through March 30, along with the market volatility that has been evident in the third quarter. Across their first 27 weeks, the funds have maintained coverage ratios at the start of each week that averaged 25.91% for EDGX and 25.42% for EDGQ. This implies that, each week, the funds have been positioned to take advantage of roughly 74.09% and 74.58% of the upside potential of the Solactive GBS United States 500 and the Nasdaq 100®, on average, plus the value of the premiums they take in.

Takeaway 3 – EDGX and EDGQ Continued to Capture Market Moves While Pursuing Targeted Distribution Rates

From their February 17 launch through the end of July, EDGX and EDGQ expressed upside capture ratios of 89.61% and 87.47% relative to the Solactive GBS United States 500 and Nasdaq 100®, respectively.¹ Over the same stretch of time they've expressed downside capture ratios of 88.37% and 88.45% against the same indices.² The figures illustrate how closely the ETFs have performed relative to these reference assets in both up and down markets. The display of softer volatility coincides with the funds maintaining distribution rates of 9.15% for EDGX and 13.34% for EDGQ as of the end of the August roll period.

Past performance is not a guarantee of future results. All fund return data is based on fund net asset value. Distribution rates do not imply rates for any future distributions.

Glossary

Term	Description	Term	Description
Call Option	An option that gives the holder the right to buy an underlying asset from another party at a fixed price over a specific period of time.	Strike Price	The fixed price at which an option holder can buy or sell the underlying asset. Also called 'exercise price'.
Implied Volatility	The market's expectation of how much an underlying asset's price will fluctuate in the future, typically derived from the pricing of options contracts on that same asset.	Moneyness	A measure of intrinsic value of an option, that is, it will tell the option holder whether exercising the option will be profitable.
Long Call	A position in a call option contract in which one has the exercisable right under the contract. This position reflects a bullish attitude.	At-the-Money	An option in which the underlying's price equals the strike price.
Short Call	A position in a call option contract one has in which the right under the contract can be exercised against oneself. This reflects bearish attitude.	In-the-Money	Options that, if exercised, would result in the value received being worth more than the payment required to exercise.
Cboe DJIA Volatility Index	Measures the market's expectation of 30-day volatility implicit in the prices of near-term Dow Jones Industrial Average Options.	Out-of-the-Money	Options that, if exercised, would require the payment of more money than the value received and therefore would not be currently exercised.
Cboe Nasdaq-100 Volatility Index	Measures the market's expectation of 30-day volatility implicit in the prices of near-term Nasdaq-100 Options.	Duration	Measure of bond price sensitivity to interest rate changes measured in years based on time until maturity.
Market Price	The current price of the underlying asset of the option contract, such as a stock.	Russell 2000	A small-cap market index consisting of the smallest 2,000 markets in the Russell 3000 Index.

Glossary (Continued)

Term	Description	Term	Description
Covered Call	An option strategy involving the holding of an asset and sale of a call option on the same asset.	Distribution Rate	The annual rate an investor would receive if the most recent fund distribution remained the same going forward. The rate represents a single distribution from the fund and does not represent total return of the fund. The distribution rate is calculated by annualizing the most recent distribution and dividing by the most recent fund NAV.
Cboe Russell 2000 Volatility Index	Measures the market's expectation of 30-day volatility implicit in the prices of near-term Russell 2000 Options.	Dow Jones Industrial Average	A price-weighted measure of 30 U.S. blue-chip companies. The index includes all industries except transportation and utilities.
Cboe Volatility Index	Commonly referred to as VIX, reflects a market estimate of future volatility of the U.S. stock market, based on the weighted average of the implied volatilities of the S&P 500.	Coin Metrics' CMBI Bitcoin Index	Benchmark index tracking the real-time, USD market value of bitcoin based on aggregate trading data from major global exchanges.
Trailing 12 Month Distributions	The distribution, as a percentage, an investor would have received if they had held the fund over the last twelve months, assuming the most recent NAV. The 12-Trailing Month distribution is calculated by summing any income, capital gains, and return of capital distributions over the past twelve months and dividing by the sum of the most recent NAV and any capital gain distributions made over the same time period.	Coin Metrics' CMBI Ethereum Index	Benchmark index tracking the real-time, USD market value of ether based on aggregate trading data from major global exchanges.
Premium	The amount of money a buyer pays and seller receives to engage in an option transaction.	Upside Capture Ratio	Measures how much of a benchmark's gains an investment experiences during periods of positive market returns.
STRIPS	Separate Trading of Registered Interest and Principal of Securities	Downside Capture Ratio	Measures how much of a benchmark's losses an investment experiences during periods of negative market returns.

Important Information

Important Information

Investing involves risk, including the possible loss of principal. Concentration in a particular industry or sector will subject the Funds to loss due to adverse occurrences that may affect that industry or sector. Investors should be willing to accept a high degree of volatility in the price of the fund's shares and the possibility of significant losses.

The Funds engage in options trading. An option is a contract sold by one party to another that gives the buyer the right, but not the obligation, to buy (call) or sell (put) a stock at an agreed upon price within a certain period or on a specific date. A covered call option involves holding a long position in a particular asset and writing a call option on that same asset with the goal of realizing additional income from the option premium. By selling covered call options, the funds limit their opportunity to profit from an increase in the price of the underlying asset above the exercise price, but continues to bear the risk of a decline in the asset. A liquid market may not exist for options held by the fund. While the fund receives premiums for writing the call options, the price it realizes from the exercise of an option could be substantially below the asset's current market price.

Investments in securities of MLPs involve risk that differ from investments in common stock including risks related to limited control and limited rights to vote on matters affecting the MLP. MLP common units and other equity securities can be affected by macro-economic and other factors affecting the stock market in general, expectations of interest rates, investor sentiment towards MLPs or the energy sector, changes in a particular issuer's financial condition, or unfavorable or unanticipated poor performance of a particular issuer (in the case of MLPs, generally measured in terms of distributable cash flow). MLPD invests in the energy industry, which entails significant risk and volatility. Small and mid-capitalization companies may pose greater risks than large companies. The MLPD also expects to pay distributions, which will be treated as a return of capital for tax purposes rather than from net profits and shareholders should not assume that the source of distributions is from the net profits of the Fund.

Neither MLPD nor the Adviser has control over the actions of underlying MLPs. The amount of cash that each individual MLP can distribute to its partners will depend on the amount of cash it generates from operations, which will vary from quarter to quarter depending on factors affecting the energy infrastructure market generally. Available cash will also depend on the MLPs' level of operating costs (including incentive distributions to the general partner), level of capital expenditures, debt service requirements, acquisition costs (if any), fluctuations in working capital needs, and other factors. The MLP holdings of the underlying fund expect to generate significant investment income, and the underlying fund's investments may not distribute the expected or anticipated levels of cash, resulting in the risk that the fund may not have the ability to make cash distributions as investors expect from MLP-focused investments.

BCCC and EHCC may not be suitable for all investors.

Bitcoin, bitcoin futures, ether and ether futures are relatively new asset class. They are subject to unique and substantial risks, and historically, have been subject to significant price volatility. The value of an investment in the Fund could decline significantly and without warning, including to zero. You should be prepared to lose your entire investment.

Important Information (Continued)

BCCC and EHCC are actively managed and invest in options contracts on one or more exchange-traded products (ETP) that invest principally in futures contracts on or invest directly in bitcoin or ether, respectively. The Funds do not invest directly in or hold cryptocurrencies. The price and performance of futures should be expected to differ from the current “spot” price of the asset. These differences could be significant. Futures are subject to margin requirements, collateral requirements and other limits that may prevent the ETF from achieving its objective. Margin requirements for futures and costs associated with rolling (buying and selling) futures may have a negative impact on the fund's performance and its ability to achieve its investment objective.

Cryptocurrency is largely unregulated and investments may be more susceptible to fraud and manipulation than more regulated investments. Cryptocurrencies and cryptocurrency futures are subject to rapid price swings, including as a result of actions and statements by influencers and the media, changes in the supply of and demand for the cryptocurrency and its futures contracts and other factors.

Fixed income securities are subject to loss of principal during periods of rising interest rates. An investment in the fund is not insured or guaranteed by the Federal Deposit Insurance Corporation or any other government agency.

There is no assurance EDGQ or EDGX will achieve its target annualized distribution rates. The actual distributions the Fund makes over a one-year period may deviate from its intended target annualized distribution rate.

QYLD, DJIA, MLPD, QYLG, DYLG, BCCC, EHCC, TLTX, EDGX, EDGQ, and TYLG are non-diversified.

Shares of ETFs are bought and sold at market price (not NAV) and are not individually redeemed from the Fund. Brokerage commissions will reduce returns. Beginning October 15, 2020, market price returns are based on the official closing price of an ETF share or, if the official closing price isn't available, the midpoint between the national best bid and national best offer (“NBBO”) as of the time the ETF calculates current NAV per share. Prior to October 15, 2020, market price returns were based on the midpoint between the Bid and Ask price. NAVs are calculated using prices as of 4:00 PM Eastern Time. The returns shown do not represent the returns you would receive if you traded shares at other times. Indices are unmanaged and do not include the effect of fees, expenses or sales charges. One cannot invest directly in an index.
